PT-4 contains a Cterminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (Interleukin-8 domain) and an activator site specific for matrix metalloproteinase MMP-9, which is produced to dissolve the tissue in front of the growing blood vessel tip to allow for its continued tissue invasion. PT-4 was designed to be cleaved into 2 distinct effectors in the presence of MMP-9. In particular, PT-4 exerts antimeoplastic and/or antimicrobial activity less than that of RP-1 in the presence of MMP-9. Thus, PT-4 exerts obtimal antimeoplastic and/or presence of MMP-9. Thus, PT-4 exerts obtimal antimeoplastic and/or is an example of context of new blood vessel formation. PT-4 is an example of context activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one of more orresponding activator sites that can each initiate or amplify the context of more each initiate or amplify the corresponding activator sites that can each initiate or amplify the context of more each initiate or amplify the context of more or amplify the context of the more or amplify the context of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of Protide-4 (PT-4), a peptide antibiotide

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide contentining a 7-13 amino acide core sequence (derived from 150 amino acide contentining a 7-13 amino acide core sequence (derived from pWP-1 and PWP-2, platelet microbial protein), and recromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial agents or potentiating antimicrobial agents or potentiating antimicrobial agents or potentiating antimicrobial agents from the secret specifically against bacteria and fungi, agents in combination with other antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of ben considered to have undesirable toxicity, immunogenicity and short of spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicity and short overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity and shortness of effectiveness due to biodegradation, retaining activity in plasma and cosmetics and even because of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acida containing a 7-13 amino acid core sequence (derived from 150 amino acida corts and peptide of 5-
150 amino acida containing a 7-13 amino acid core sequence (derived from truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents to antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of antimicrobials, agents that enhance, potentiate or restore efficacy of antimicrobials, agents that enhance the antimicrobial companients and as agents to improve efficiency of molecular or foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short to be an considered to bave undesirable toxicity, immunogenicity and short care based upon natural antimicrobial peptides that have potent and broad

crivity or for potentiating antifactobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting containing an amino acid sequence selected from the group consisting selected from XZBBZKBXB, BXZXZB, XBBXZXBX, and its derivatives selected from the group consisting of xBBXBXBX, BXXXZBX, XBBXZXBX, and BBXZBBXZ; and (b) a second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBX, XBBXXBXB, XBBXXBBX, BXXBXXB, XBBXXBB, and XBBZXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid cused in the exemplification of the present invention
spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

The invention relates to an antimatorobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from the period are (i) parability and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also consider are (i) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as bacteria and fungi. The containing an amino acid conventional apprides are useful as bacteria and fungi. The peptides for conventional antimicrobials, agents that enhance the antimicrobial with other antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in the considered to have undesirable toxicity, immunogenicity and short been considered to have undesirable toxicity, immunogenicity and short conservatives adminicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad espectrum activity against leaves inherent mammalian cell taxicity experience. The periods and considered to have undesirable mammalian cell taxicity in the present invention are based upon natural antimicrobial apprides that thave potent and broad espectrum activity against periods inherent mammalian cell taxicities and diversions of functions of functions of functions of functions are based upon natural antimicrobial and manual and antimicrobial and antimi

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXZB, XBBXXZBX and BMXZBXZ; and (b) a second peptide template XBBXXXBX, BXXXBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXXBX, XBBXXXBB, and XBBXXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AMX57463 to AAX57757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for potentiating antimicrobial agents active

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-7 containing an amino acid core sequence selected from truncations and fusions; and (2) and retromers, extensions, combinations and fusions; and (2) and retromers peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The artimicrobial peptides are useful as individual antimicrobial agents, agents that enhance the antimicrobial antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial for unctions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular conventions and commissional peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity immunostical inconsidered to have undesirable toxicity, immunostical immunostical inconsidered to have undesirable toxicity, immunostical im
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB1678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The mucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) aradiovastes such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 11; SEQ ID NO 3441; 1701pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 43; DB 4; Length 74; Pred. The invention relates to human polynucleotides (AA179941-AA193841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, call proliferation or call differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity infinibin activity and may be useful in the diagnosis and/or treatment of cancer, leuksemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cationic antibacterial protein; lipopolysaccharide binding; anticoagulant; granulocytes; RNIP; LPS; sepsis; autoimmune disorder; septic shock; rabbit; CAP18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

The present sequence represents a heparin-binding sequences, derived from a human cationic protein, having lipopolysaccharide binding and anticoagulant activity. The polypeptide is designated CAP18. Amino acids 134-170 of CAP18 represent a reactive nitrogen inhibitory protein (RNIP). The CAP18 polymucleotide is useful for producing cationic proteins. The TAP18 polymetide is useful for reacting and diagnosing lipopolyaaccharide-associated conditions such as gram negative sepsis, and/or coagulation-related disorders, such as disseminated intravascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBKBK and its derivatives selected from XZBBZBXBKB, BXZXB, XBBXZXBBX and BBXZBBXZ; and (b) as second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, XBBXXBBX, XBBXXBBX, where B = at least one positively charged amino acid; X = at least one aromatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an antimicrobial peptide (AP) for direct
                       Novel human cDNA encoding cationic proteins having lipopolysaccharide binding and anticoagulant activity, useful for treating and diagnosing gram negative sepsis and disseminated intravascular coagulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

AAB70648 to AAB70675 represent antimicrobial peptides (I), of which AAB70648 to AAB70664, AAB70674 and AAB70675 are derived from the ovine SAB70648 to AAB70664, AAB70675 are derived from the lupine activity peptide, and AAB70655 to AAB70673 are derived from the lupine RCAP 18 cathelicidin family peptide. (I) have antibiotic, antimicrobial and antiviral activities, and can be used as microbial growth and proliferation inhibitors and in gene therapy. (I) are useful for inhibiting microbial growth in an environment capable of sustaining such agrowth, for inhibiting microbial growth or strain in a host, and inhibiting the growth of drug-resistant microbial strains such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inhibiting the growth of drug-resistant microbial strains such as
Pseudomonas aeruginosa, Burkholderia cepacia, Alcaligenes and Xanthomonas
                amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANY57463 to ANX57557 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lupine RCAP 18 cathelicidin derived antimicrobial peptide SEQ ID NO:20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptides useful as antibiotics for inhibiting growt and proliferation of microbes, and for treating microbial infections.
                                                                                                                                                                                                                    Gaps

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-

150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derivatives from 150 amino acids containing an articolar acids fusions and their derivatives. The possible structures are fully described in the specification. Also conformations are fully described in the specification. Also core sequence selected from truncations of the peptide activity or for potentiating antimicrobial apents active against organisms such as bacteria and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of specifically against bacteria and fungi, agents in combination with other specifically against bacteria and fungi, agents in combination with other conventional antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in foods and commetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have present invention are based upon natural antimicrobial peptides that have present invention are based upon natural antimicrobial peptides that have generally considered to have undesirable to effective and as agents to improve an effect of the effective and as agents to improve of the present sequence is a rabbit pub based antimicrobial peptides of the present sequence is a rabbit pub based antimicrobial peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting

The composition of the invention demonstrates antibacterial and antifungal activities and may be useful for preventing a disease in an organism, for generating cultivated plants and in providing resistance to plant tissue against fungi such as Pyricularia and na specudomonas etc. The composition has high antimicrobial activity at low concentration. The current sequence is that of the rabbit CAP18 peptide fragment of the
                                                                                                                                                                                                                                                                                                                                                                                                                    Antimicrobial polypeptide composition for a plant pathogen, comprises one or more types of thionine and/or a polypeptide having an alpha helix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polypeptide composition for preventing

                                                                                                                                              AAB70648 to AAB70675 represent antimicrobial peptides (I), of which AAB70648 to AAB70664, AAB70674 and AAB70675 are derived from the ovine SMAP 29 cathelicidin family peptide, and AAB70665 to AAB70673 are derived from the lupine RCAP 18 cathelicidin family peptide. (I) have antibiotic, antimicrobial and antiviral activities, and can be used as microbial growth and proliferation inhibitors and in gene therapy. (I) are useful for inhibiting microbial growth in an environment capable of sustaining such growth, for inhibiting microbial growth or strain in a host, and inhibiting the growth of drug-resistent microbial strains such as Pseudomonas aeruginosa, Burkholderia cepacia, Alcaligenes and Xanthomonas
New antimicrobial peptides useful as antibiotics for inhibiting growth and proliferation of microbes, and for treating microbial infections.

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

Disclosure; Page 108; 166pp; English.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB. BXZXBX XBBXZXBBX and BBXZBBXZ; and (b) as second peptide template XBBXZXBB, XBBXZXBBX and BBXZBBXZ; and (b) group consisting of XBBXBBX, BXXBXXB, XBBZXXBB, and XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; X = at least one aromatic amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial peptides are useful as individual antimicrobial against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 anino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations and fungical above,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

ö
been considered to have undesizable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           core sequence selected from fruncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The estimate of the antimicrobial peptides are useful as individual antimicrobial agents has reserved at minicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as dishifectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular cology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short all-lives due to biodegradation. The peptides of the present invention spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXZBXB and BRXZBBX; and (b) as second peptide template XBXXBXXBXB and BRXZBBX; and (b) as second peptide template XBBXXBB, BXXXXBX, BBZXBBX; and (b) as second peptide template XBBXXBBX, BXXBXXBB, and their derivatives selected from the group consisting of XBBXXBBX, XBBXXBB, and their derivatives selected from the XBBXXBBXXBBXXBBX; where B = at least one positively charged amino acid; z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other canno acids. The peptides can be used to treat bacterial and fungal neutrophils. The peptides overall effect cellular distribution and rapid applesis of microbial cells. ANYSTAST tepreseent sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derived from 50 amino acids containing a 7-13 amino acid core sequence (derived from 50 amino acids combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also core sequence selected from truncations of the peptides described are (1) an antimicrobial apents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fungio. The antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents.

Specifically against bacteria and fungi, agents in combination with other antimicrobial agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial convention of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular conventional antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and socratic spectrum activity against pathogens exhibiting multiple antibiotic covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, relaining activity in plasma and complex of the peptides of the present sequence is a rabbit pwp addictiving antimicrobial peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection, fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against conganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBBA and its derivatives selected from XZBZBXBBX, BXZXXB, XBBXZXBBX and BBXZBBX, and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, and their derivatives selected from the group consisting of XBBXBBX, and their derivatives selected from the group consisting of XBBXBBX, and their derivatives and (b) at least one aromatic amino acid, and where B, x and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of intercious.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial peptides for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide contentaning a 7-13 amino acide core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid or retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fungion; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials agents to improve efficiency of molecular fonds and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short that half-lives due to biodegradation. The peptides of the present invention are broader and proper are based upon natural antimicrobial peptides of that present invention are broadent and antimicrobial peptides of prior art have general to are based upon natural antimicrobial peptides of that present invention are been considered to bave undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that between the present invention are because the considered to bave undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have present and broad are based upon natural antimicrobial peptides that persent and proper are based upon natural antimicr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXXZB, KBBXZXBBX and BBXZBBXZ, and (b) a second peptide template XBBXX BXXBXB, MBBXXBB, and consisting of XBBXBBX, XBBXXBB, BXXBXXB, MBBXXBB, and Consisting of XBBXBBX, XBBXXBBX, BXXBXXB, MBBXXBB, and Consisting of XBBXBBX, MBAXBBX, BXXBXXB, MBBZXXBB, and consisting of XBBZXBBX, BXXBXB, BXXBXB, and consisting of XBBZXBBX and their derivatives selected from the group consisting of XBBZXBBX, BXXBXB, BXXBXXB, and a least one annopolar hydropholic amino acid, z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of apoptosis of microbial cells. ANSTAGS to AANSTAGS represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

                                                                                                                                                                                                                                                                                                                                               The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms and that and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXXB, XBBXZXBBX and BXZBBXZ; and (b) a second peptide template XZBXXXB, XBBXXXBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXXBX, BXXBXXB, XBBXXXBB, and XBBZXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = ar least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AX737463 to AAX5757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection, fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as or for potentiating antimicrobial agents active against organisms such as ore sequence selected from truncations and fusions; and (2) and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides are useful as individual antimicrobial agents, and minimicrobial peptides are useful as individual antimicrobial agents that enhance the antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial activity of antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial for conventional antimicrobials, agents to improve efficiency of conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial perides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short been considered to have undesirable toxicity, immunogenicity and short.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
CC 150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers,
CC PMP-1 and PMP-2, platelet microbiocidal protein), and retromers,
CC truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 contraining an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions such as such as such and fungi. The law of the second antimicrobial agents that enhance the antimicrobial agents that enhance the antimicrobial activity of conventional antimicrobials, agents that enhance the antimicrobial or foods and cosmetics and as agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic confessed to biology techniques of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and every and shortness of defectiveness due to biodegradation, retaining activity in plasma and every and shortness of effectiveness due to biodegradation, retaining acti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                             New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XEBZENEXB and its derivatives selected from XEBZENEXB. BXZXZE, XEBZENEBX and HEXZEBSZ, and (b) a second peptide template XEBZX BXZXZE, XEBZENES, and exproup consisting of XEBZENES, and their derivatives selected from the group consisting of XEBZENES, and their derivatives selected from the group consisting of XEBZENES, and their derivatives where B = at least one positively charged amino acid; X = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7461 to AAYS7557 represent sequences

autimicrobial peptides are useful as bacteria and fungi. The antimicrobial peptides are useful as individual autimicrobial against organisms such as bacteria and fungi, agents in combination with other specifically against bacteria and fungi, agents in combination with other autimicrobials, agents that enhance the autimicrobial conventional antimicrobials, agents that enhance the autimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                          against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of
                                                                                                                              New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABG69925
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXBX, XBBXZBBX and BBXZBBXZ; and (b) a second peptide template XBBXXBX, XBBXXBXB, XBBXXBBX, and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXXBB, and XBBZXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANY5757451 tepresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                       Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against.

corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XEBEXEXE and its derivatives selected from XEBEZEXENS, BXXXZB, XBBXZXBA and BEXZBBXZ; and (b) a selected from XEBEZEXENS, BXXXZB, XBBXZXBA and BEXZBBXZ; and (b) a selected from XEBEZEXENS, Where B = at least one positivatives selected from the group consisting of XEBEXEX, XBBXXZBB, BXXXBX, BXXEXXB, SBEZXENS, and xBEZXENSY, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of apoptosis of microbial cells. ANSTAGS to AANSTAST represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                Antimicrobial peptides for potentiating antimicrobial agents active

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The inversion transfer to an antimitation between the inversion of a peptide of 5-150 amino acids containing a 7-13 amino acid comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2. platelet microbiocidal protein), and retromers, cremeions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also concluded are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides are useful as individual activity of antimicrobial peptides are useful as individual activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance potentiate or restore efficacy of conventional antimicrobials agents to improve efficiency of molecular fonds and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides of prior art have general and spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicity in an experience problems of toxicity, immunogenicity, and shortness of duration and antimicrobial activity and shortness of duration and antimicrobial activity and shortness of duration and antimicrobial activity and short in a prior art and activity and short in a prior art and activity and short in a prior art and activity an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of effectiveness due to biodegradation, retaining activity in plasma and
serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                              The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers.

Truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) autimicrobial peptides for potentiating antimicrobial agents of leukocytes against organisms such as bacteria and fungi. The leukocytes against organisms such as individual antimicrobial agents that enhance the antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobial peptides are useful as individual antimicrobial agents of conventional antimicrobials, agents that enhance the antimicrobial for antimicrobials, agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in the foods and cosmercies and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short ball-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicity immunosicity and short infernations are based upon natural antimicrobial antimicrobial antimicropial antimicrobial antimicrobial antimicrobial antimicropial antimicrobial antimi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                            New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 47; DB 5; Length 20;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXENS and BEXZBBX.

Selected from XZBBZNSRAS, BXZZSB, XBBXZXBX and BEXZBBXZ and (B) a second peptide template XBBXXB, WXBXXBBX and BEXZBBXZ, and (b) group consisting of XBBXZBBX, XBBXXBBX, BXXBXXB, XBBZXBB, and their derivatives selected from the group consisting of XBBZXBBX, Where B = at least one positively charged amino acid, x = at least one positively charged amino acid; x = at least one positively charged amino acid; x = at least one positively charged amino acidi. The peptides can be used to treat bacterial and fungal mino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAN57463 to AAN57557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting

                                                              The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide contening a 7-13 amino acide core sequence (derived from PMP-1 and PMP-2, platelet microbial protein), and rerromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as core sequence selected from truncations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesizable toxicity, immunogenicity and short because of the considered to have undesizable toxicity, immunogenicity and short because of the considered to have undesizable toxicity, and short and an against because of prior art have generally been considered to have undesizable toxicity, and short and an against and as agents to improve calling and an adversally been considered to have undesizable toxicity, and short and an adversally and short and a supposition of the adversally and short and an against and toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

The present sequence is that of Protide-1 (PT-1), a peptide antibiotide with distinct effector and activator domains. PT-1 contains a C-terminal antihing distinct effector and activator domains. PT-1 contains a C-terminal contains a periode effector (RP-1), an N-terminal chemokine-like peptide effector (Interleukin-8 domain) and an activator site specific for staphylococcus (N protease. PT-1 was designed to be cleaved into 2 distinct effectors in the presence of VB protease. In particular, it was casing deto exert antimicrobial activity less than that of RP-1 in the absence of VB protease produced by Staphylococcus aureus. Thus, PT-1 cwas designed to exert optimal antimicrobial activity in the context of infections due to staphylococcus aureus. Thus, PT-1 cwas designed to exert optimal antimicrobial activity in the context of infections due to staphylococcus cells elaborating the virulence factor VB protease. PT-1 was synthesised by solid-phase synthesis. It is an case effectors with individual distinct biological functions and one or more effectors with individual distinct biological functions and one or corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad trange of pathological conditions.
                                                                                              New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

cor for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of elevicoytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, apents that enhance, potentiate or restore efficiacy of conventional antimicrobials, agents that enhance, potentiate or restore efficiacy of conventions of leukocytes, as disinfectants or preservatives for use in thuctions of leukocytes, as disinfectants or preservatives for use in comparation and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and effectiveness due to biodegradation, managemicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

                                  The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XXBZBXBXB and its derivatives selected from XZBBZBXBXB and its derivatives as second peptide template XBXZXBX xBXXXBBX and BBXZBBXZ; and (b) a second peptide template XBBXX and their derivatives selected from the XBBZXXBBX, where B = at least one positively charged amino acid, x at least one aromatic amino acid, and where B, X and Z may be separated by one or more other
                                                                                                                                                                                                                                                    amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences
